

Installing macOS Internal Apps

Written By **Ky Young** (@unc0vrd)

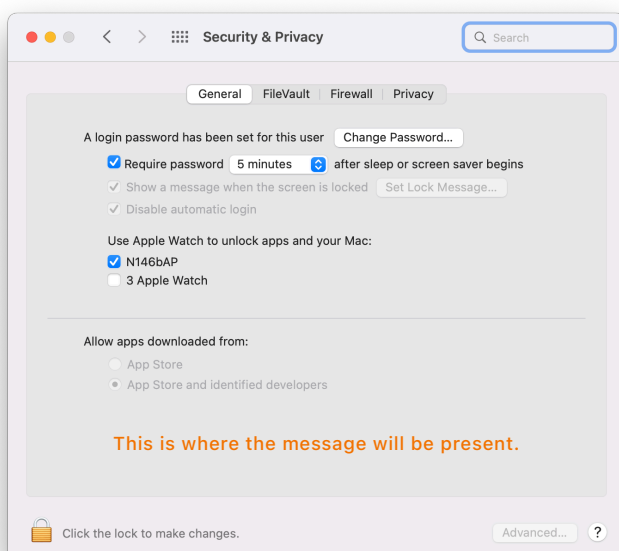

macOS Internal Applications are only supported on Intel Macs, a method for M1 Macs is being investigated by Internal Archive.

macOS Internal apps do not really serve any purpose to anyone without special tools or an Apple Connect account, although, they can be a good addition to any Apple Internal enthusiasts Mac! macOS Internal apps aren't too hard to find, and also aren't hard at all to install! This guide will talk you through the process of installing macOS Internal Apps on your Mac (Catalina through to Monterey), so you can start exploring!

Before You Start

Install is relatively easy for Apple Internal utilities, although, you must ensure you have an Intel Mac, you can check by typing "About This Mac" into spotlight search, and checking what processor/chip you have. If it says "Chip: M1" your Mac is incompatible with these utilities, and you must wait for a method for installation to be found. If your processor has "Intel" in the string, congratulations, your Mac is compatible and you can continue following this guide!

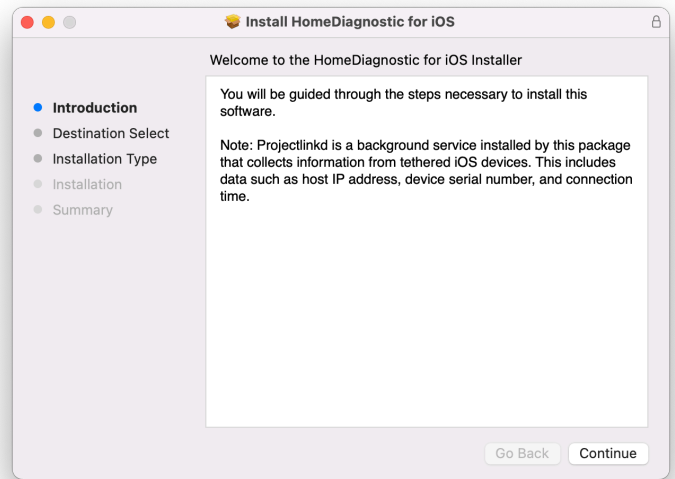

Step 1.

At the bottom of this guide is the download link for HomeDiagnostics, using this, a file should be downloaded called "HomeDiagnostics (18B86).pkg", once the download is completed, double click the file to open it, GateKeeper may step in and prevent it the package from opening, however, just navigate to System Preferences > Security & Privacy and press "Open Anyway" on the message at the bottom of the window.

Step 2.

You should be greeted with an install window, titled "Install HomeDiagnostic for iOS", if so, we shall proceed. The install is rather simple from this point onward, it is similar, if not the same as installing any other macOS Application via a .pkg file! Click Continue > Install > Type In Your Passcode, and wait for the Installation to complete! You may need to restart your Mac once installation is complete!

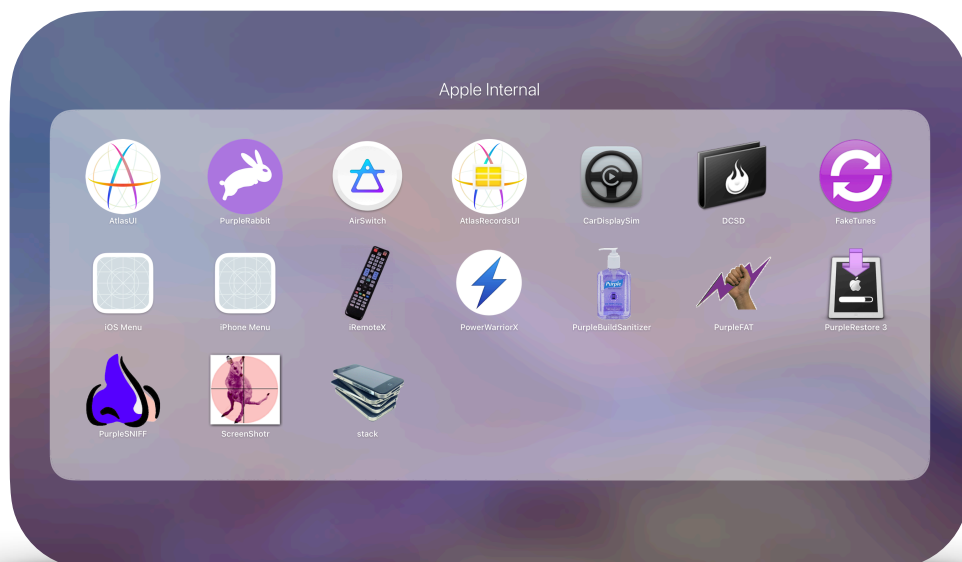

Conclusion

A folder in Launchpad called "Apple Internal" will now be visible, this folder contains all the macOS Internal Applications that are included in HomeDiagnostics (18B86), although there are some installers that contain different Apps.

Note: Some, if not most Applications serve absolutely no purpose to the standard user without special tools or an Apple Connect account.
